

Pacific Biological Laboratories

Pacific Grove, California

Fri May 7, 1948

Dear Jn:

I am enclosing several things with this letter (and I hope I remember to do so)

- 1. A casual general map of the region which will serve for rough orientation (If you require it, you may get a good map of the area there in NY from the Navy Hydrographic Office, there are several HO charts, one for the whole region, I forgot the number. I have them all, but you may want a reference copy there in NY. The HO will have a guide map from which selection can be made, 50-75c each)*
- 2. A schedule of tides, by this you will see that if you can get there a day or so sooner than the 21st, you can get in on a few days extra collecting. In other words, land right down in the midst of it. The set centering around the 21st isn't nearly as good as the one centering around July 6th or 7th, but its OK for some of the quantitative work. I often go out even on fairly high tide, see what occurs there. And sometimes follow high tide on down.*

Something else, forgot now; well when it ____ up I'll write again.

Looks as tho I'm going to have an increasingly busy time until we get started. CalpPack is also loving me hugely right now. Assigning things to me that arn't routine at all, and I have use my head which I'd rather use for the other work right now especially. Some new work with effect of DDT on Gambusia- the mosquito fish, one of the research dept. guys coming in next week to explain about it. And I still have quite a little arranging to do with specialists. The experimental canning of salmon goes on here, and I'm interested in in finding out what I can about the meal and oil and Vit A. Spectrophotometer extinction coefficient curves to compare with those of liver oil, of sardine and anchovy oil. Rik coming down tonight I guess with the beautiful Chinese girl. Alice is in fine fettle and her excellent work on the index and other things is a constant joy to me. I wish I new some

chemistry. I wish I were better than a terrible mathematician. Well for that matter while I'm wishing things, let me wish for good observing ability and greater efficiency. I do envy that man Stephenson.

Dear John:

I am enclosing several things with this letter (and I hope I remember to do so):

1. A casual generalizing of the region which will serve for rough orientation. (If you require it, you can get a good map of the area there in NY from the Navy Hydrographic Office, there are several NO charts, one for the whole region, I forget the number. I have them all, but you may want a reference copy there in NY. The NO will have a guide map from which selections can be made, 60-75c each)
2. A schedule of tides. By this you will see that if you get up there a day or so sooner than the list, you can get in on a few days extra collecting. In other words, land right down in the midst of it. The set centering around the list ~~isn't~~ isn't nearly as good as the one centering around July 6th or 7th, but its OK for some of the quantitative work. I often go out even on fairly high tides, see what occurs there. And sometimes follow a high tide on down.

Something else, forget me; well when it turns up I'll write again.

Looks as tho I'm going to have an increasingly busy time until we get started. CalPack is also loving me hugely right now. Aceding things to me that aren't routine at all, and I have to use my head which I'd rather save for other work right now especially. Some new work with effect of DDT on *Capusia* - the mosquito fish; one of the Foxeason Dept. guys coming down next week to explain about it. And I still have quite a little arranging to do with specialists. The experimental rearing of salmon goes on here, and I'm interested in finding out what I can about the meal and oil and vit A. Spectrophotometer extinction coefficient curves to compare with those of liver oil, of sardines and sardine oil. Mik coming down tonight I guess with the beautiful Chinese girl. Alice in fine fettle and her excellent work on the index and other things is a constant joy to me. I wish I knew some chemistry. I wish I were better than a terrible mathematician. Well for that matter while I'm wishing things, let me wish for good observing ability and greater efficiency. I do envy that man Stephenson.
